Flora and Fauna

Fauna

MANED HUNTING DOG

- Height:** 1 metre
Weight: 80 kg
Frequency: Moderate
Habitat: Plains
Abilities: Locking Jaws, Able to run for miles, Acute Hearing, Retractable Claws
Description: Large and Ranging, Manned Hunting Dogs can be trained to hunt for humans. Although wild in nature, if reared from pups they can become very loyal. They have large canine teeth and a very distinctive mane. Usual colour is Dun Orange to Orche Yellow (In rare cases black). They have green eyes.

PELMER

- Height:** 2 metres
Weight: 70 kg
Frequency: Common
Habitat: Forests
Abilities: Hard Head Crown
Description: Carnivorous Flightless bird, large range of colours. Very aggressive, territorial. Red eyes, very powerful legs with 3 toes feet, that can kill an adult human. Hooked beak and a tail that fans out when threatened or attacking

Flora and Fauna

DUAL TAILED GLIDER

- Height:** .5 metres
Weight: 2 kg
Frequency: Common
Habitat: Plains and Forest
Description: Similar in size to a falcon and is actually carnivorous despite it being related to its herbivorous glider brethren. Often sought out to be trained by falconers for sport, hunting and as animal companions. It has keen senses and can see exceptionally well in all kinds of light and dark.

LEAFED HARE

- Height:** 0.5 metres
Weight: 5 kg
Frequency: Common
Habitat: Plains
Description: Just like a rabbit but grows leaves upon its head to blend in with its surroundings. These leaves come in a variety of colours depending on its habitat and it can also climb trees.

Flora and Fauna

GRIMWARD

- Height:** 10 metres
Weight: 60 kg
Frequency: Rare
Habitat: Dark forests and deep caves
Abilities: Swim
Description: A predator that relies on ambush, it can swim but only for short bursts. They are venomous creatures with a tail like a sledgehammer whip. They are prized for their hides.

Flora and Fauna

Flora

VISCERA UTOR (FLESH EATER)

Size: Up to 4 metres wide but can stretch for miles

Frequency: Moderate

Habitat: Dense Forest Areas

Description: Viscera Utor, more commonly known as the flesh eater, is a forest vine that clings harmlessly to other trees when not out for a kill. The Viscera Utor can not live in direct sunlight and flourishes in forests with a thick canopy.

Featuring large yellow flowers, the Viscera Utor attracts its prey with the amazing scent of its large and impressive blooms.

The plants vines are naturally drawn to the body heat of their prey, the plant then uses ground trailing vines to snag its prey and draw it towards the root source of the plant.

One plant can easily span over a mile, so if you hear the sound of terrified screaming from the woods, its recommended to cover your ears and let the victim be consumed.

At its source the vine then wraps around the victim, completely encasing the body, before potent chemicals from the plants leaves, liquify the corpse, thus feeding the plant.

The extract of the Viscera Utor's leaves can be used in powerful magics, but many have died in their venture to obtain these leaves as the necessary leaves are only found around the central core of the plant. They are at their most potent when freshly harvested.

The core root base of the adult Viscera Utor features large blade like leaves. In the centre, these expand skyward, extending tiny head vines skyward towards warmth.

Around the perimeter of the plant, leaves push outwards, ready to wrap around their victim.

Thick foot vines trail from below the lowest leaves, trailing outwards.

Head vines, the most visible part of the plant, extend skyward, trailing from tree to tree like a web.

These small vines are at their thickest, approximately as thick as a woman's pinkie finger, and are drawn to warmth, as warmth helps the plant manufacture the liquifying compound found in the cores bladed leaves.

When prey is in proximity, head vines instinctively move toward their target, sending signals through the plant to the foot vines, which then creep towards their prey. Foot vines are often a deeper green brown in colour and camouflage well in the dirt.

The Flowers of the Viscera Utor plant can be as large as a bread plate, and are multi petalled, bright yellow flowers. Although their smell is insanely enticing to anyone who smells it, nobody who has ever lived to tell the tale can quite describe what it smells like.

So vivid is the flowers colour that even in a dimly lit forest, the flowers vibrant hues are highly visible and attract the bystander.

Once within distance of the stunning flower, the overwhelming scent attracts the plants prey even closer, this then causes the preys body warmth to attract the plants tiny tendrils to the victim.

Once the tendrils are alerted to the presence of prey, it takes mere moments for the many foot vines to move towards the victim and ensnare them. Viny hands wrap around the victim's legs, pulling them to the ground and dragging the body towards the plants core.

Flora and Fauna

PELTFERN

Size: 2 feet tall. 2 feet wide

Frequency: Common

Habitat: Forests

Description: Growing in the forests it can be mistaken as small animals but it's not, although it could be difficult to tell at night or low light. It's just a nice little plant that can grow up to 2 feet tall and 2 feet in diameter. It's commonly harvested to make warm fabrics and rope out of.
